

Incident report analysis

Summary	organization's network services suddenly stopped responding due to an incoming flood of ICMP packets. Normal internal network traffic could not access any network resources. The incident management team responded by blocking incoming ICMP packets, stopping all non-critical network services offline, and restoring critical network services. the internal network was compromised for two hours until it was resolved.
Identify	The company's cybersecurity team then investigated the security event. They found that a malicious actor had sent a flood of ICMP pings into the company's network through an unconfigured firewall. This vulnerability allowed the malicious attacker to overwhelm the company's network through a denial of service (DoS) attack.
Protect	Protect internal assets through the implementation of policies, procedures, training and tools that help mitigate cybersecurity threats. • Source IP address verification on the firewall to check for spoofed IP addresses on incoming ICMP packets • Network monitoring software to detect abnormal traffic patterns • An IDS/IPS system to filter out some ICMP traffic based on suspicious characteristics Any suspicious packet or known attack

	A new firewall rule to limit the rate of incoming ICMP packets
Detect	The using of IPS will detect the DOS attack ,block it and inform the admin
Respond	The incident management team responded by blocking incoming ICMP packets, stopping all non-critical network services offline, and restoring critical network services.
Recover	Recover affected systems to normal operation and restore systems data and/or assets that have been affected by an incident. And compare the baseline with the current situation
